Most of the students were juniors. The students complained that the reading level was above their heads and that it wasn't very helpful. Personally, I thought it was well-written and insightful. I would recommend making sure that your students have enough of a research background and high enough of a reading level before selecting this book for a course. 0 of 0 people found the following review helpful. An excellent book for conducting research By Gertrude Morris The book was very informative, thus describing

everything from the process of research, designs and methods to employ, when conducting research. It's very helpful, when it comes to collecting data, data analysis and so on. Additionally, it's useful in describing how to construct a research question and that of a hypothesis, and strategy. Overall, the book is excellent for researchers, wanting to learn how to conduct research at a graduate and scholarly level. The book is highly recommended for graduate students and those who are conducting post graduate work in research, methods, ethics and the statistical aspect of research. Everything you want to know about research can be found in the book: *Critical thinking about research: Psychology and related fields*. The book was particularly helpful in my gaining a precise understanding in approaching research and the critical thinking which is a vital part of research as well as other aspects of diversity that is an important role that integrates into research, in other words the ins and outs of research, a must read book. 0 of 0 people found the following review helpful. Four Stars By Joanna Definitely helped a lot understanding how to approach research papers

Could the research you read be fundamentally flawed? Could crucial defects in methodology slip by you undetected? To become an informed, interactive consumer of research, you may need an attitude adjustment: from acceptance to inquiry, from reverence to skepticism. *Critical Thinking About Research: Psychology and Related Fields* equips you with those tools needed to identify errors in others' research and to reduce them to a minimum in your own work.
